- 2 Palm Beach County Glades Airport Demand/Capacity and Facility Requirements
- 3 Palm Beach County Glades Airport Environmental Overview
- 4 Palm Beach County Glades Airport Development Alternatives
- 5 Palm Beach County Airports Financial Planning
- 6 Palm Beach County Glades Airport Airport Layout Plan

## Master Plan Update

As defined by the Federal Aviation Administration (FAA) in Advisory Circular (AC) 150/5070-6B, *Airport Master Plans*, a master plan is defined as a concept for potential long-term development of an airport. It entails a series of planning steps that analyze how expected future aviation demand can best be accommodated, including a graphical representation of the findings.

The goal of a master plan is to provide solutions that will satisfy the expected future needs of an airport in a financially feasible manner, while accounting for the surrounding community, local environment, and socioeconomic factors. Additionally, because future travel demand will change over time, a master plan must allow the airport flexibility to implement different projects to meet actual demand. Airport planning begins with a careful assessment of existing facilities and current airport use, and projections of aviation demand over a specific timeframe, also known as the "planning period." The planning period here is the 20-year period **2005-2025**.

The recommendations provided in a master plan are technically sound and meet FAA standards, but are only recommendations: implementation of any projects can occur only as warranted by need. The recommendations outlined in the plan are also subject to further FAA review and environmental/feasibility studies before implementation.

## Palm Beach County System of Airports

The PBC Department of Airports (DOA) owns and operates a system of four airports; Palm Beach International Airport (PBI), Palm Beach Park Airport (LNA), Palm Beach County Glades Airport (PHK), and North Palm Beach County General Aviation Airport (F45).

PBI is the center for all commercial air carrier service into Palm Beach County, while together, LNA, PHK, and F45 accommodate most of the general aviation demand in the region. Both LNA and F45 are designated as a "reliever airport" by the FAA. As reliever airports, F45 and LNA relieve congestion at Palm Beach International Airport, by providing an alternate venue for general aviation traffic. The County chose to update all four master plans, rather than only PBI's plan, for the purpose of assuring that the relievers can continue to fulfill their missions of offloading PBI as well as meeting local general aviation (GA) demand.

Specific goals and objectives were developed as guidelines in assessing various alternatives for future development for the system of airports. The goals were identified as the following:

 Accommodate passenger demand while maintaining the highest level of customer service and convenience possible, including an emphasis on low delay and congestion levels.

- → Refine and validate selected long-term airport improvements that meet forecast airline, corporate, and general aviation system demand, while providing flexibility to respond to actual demand.
- → Develop an enhancement plan that meets FAA standards, is financially sound, environmentally responsible, and consistent with the County's established good neighbor programs.

## **PHK Executive Summary**

The PHK Master Plan Update was substantially influenced by Hurricane Wilma. PHK, located 35 miles west of West Palm Beach and three miles southwest of Pahokee, was directly in the path of Hurricane Wilma, and suffered extensive damage. All of the airport buildings, including the terminal housing the FBO, a large hangar, and 10 T-hangars, were completely destroyed or severely damaged, as were a number of aircraft. Airport management quickly implemented interim measures to minimize service interruptions, but clearly a financially-sound and well-planned long term restoration effort was needed. And since extensive rebuilding would be required, an opportunity presented itself to modernize completely the airport's infrastructure to best meet the future needs of the airport users over the next several decades.

The 2006 Master Plan was fashioned to review and verify the validity of previously evaluated alternatives and recommended measures from an earlier (March 2001) master plan.1 The results of the reviews are highlighted below.

## Airfield Demand/Capacity Analyses

The 2006 Master Plan confirmed that PHK's single runway – Runway 17/35 – is sufficient to meet the projected aviation demand through the year 2025 (**Table ES-14**).

| Annual Service Volume        |          |                         |
|------------------------------|----------|-------------------------|
|                              | 2006 Mas | ster Plan <sup>1/</sup> |
|                              | 2005     | 2025                    |
| Annual Aircraft Operations   | 34,200   | 45,160                  |
| Annual Service Volume        | 69,250   | 69,250                  |
| Percent of Operations to ASV | 49       | 65                      |

TABLE ES-14 Annual Service Volume

<sup>1/</sup> Source: CH2M HILL and Ricondo & Associates, "Palm Beach County Glades Airport - Demand/Capacity and Facility Requirements," October 2006

Table ES-14 introduces the term ASV which at PHK is equivalent to approximately 76,950 operations, which is reduced by 10 percent to reflect the lack of an Air Traffic Control Tower (ATCT) at PHK. The resulting ASV for the airport is presented as 69,250 operations.

In order to minimize aircraft delays, the FAA recommends that alternatives to increase capacity be considered once the volume of annual operations reaches 60-75 percent of an

<sup>1</sup> Master Plan Update for Palm Beach County Glades Airport, prepared for the Palm Beach County Department of Airports by Dames and Moore, March 2001

airport's computed Annual Service Volume2. As indicated in Table ES-14, airfield capacity is not considered a significant issue until well beyond 2020.

### **Based Aircraft**

The 2006 CH2M HILL Team reduced the number of aircraft projected to be based at PHK over the planning period (see **Table ES-15**). Assuming all based aircraft are parked in hangars, the projected need for hangar space through the planning period is tabulated in **Table ES-16**.

| TABLE ES-15<br>Comparison of Based Aircraft, 2001 and 2006 |                         |         |                         |  |  |  |  |

<sup>2</sup> FAA Order 5090.3C, Field Formulation of the National Plan for Integrated Airport Systems, December 4, 2000.

### **Itinerant Aircraft**

The aircraft parking ramp currently has positions for 13 tie-downs, but these positions are too wide for the type of aircraft currently utilizing the airport. Once updated with Airplane Design Group (ADG) I spacing requirements, the existing 180,000 square-foot apron will be able to accommodate 28 tie-down positions.3

### Summary of PHK Facility Requirements

The 2006 Master Plan reflects the following:

- 1. A new terminal building of the same size of the former is adequate to meet projected aviation needs through the planning period.
- 2. The existing two underground fuel tanks (15,000 gallons AvGas, 15,000 gallons Jet-A) are sufficient in size and condition to meet the projected need for aviation fuel.
- 3. Ground access and the existing 14-space vehicular parking lot are considered adequate to meet needs through the planning period.

## **Proposed Projects**

In the wake of Hurricane Wilma, the 2006 Master Plan offered a unique opportunity to analyze the needs of PHK from the ground up to determine specifically what facilities and infrastructure are necessary to serve future aviation demand. Because so many aging and obsolete buildings suffered considerable damage, tearing them down and rebuilding to modern-day codes and standards is considered the preferred option. Measures proposed to address future needs and demand are as follows:

- Replace hurricane-damaged structures, such as the terminal building and hangars, with new facilities built to modern-day codes and standards;
- Resurface the itinerant aircraft parking areas and remark the existing space to maximize utility;
- Acquire land tracts within the RPZ to meet FAA requirements for compatible land use
- Update NAVAIDs such as directional lighting; and
- Increase auto parking spaces at or near the proposed new aircraft hangars.

The preferred plan, shown in **Exhibit ES-7**, includes a row of T-hangars, encompassing a total of 14,170 square feet, proposed east of the existing T-hangars, and north of the apron. The automobile parking spaces required are accommodated north of the conventional hangar and access road, replacing the existing unpaved lot.

<sup>&</sup>lt;sup>3</sup> Airplanes are placed in "Design Groups" based on wingspans. Airplane Design Group (ADG) I covers planes with wingspans up to but not including 49 feet; ADG II, wingspans 49 feet up to but not including 79 feet; and so on through ADG VI, wingspans 214 feet up to but not including 262 feet. ADG I covers the overwhelming majority of small turboprop planes, i.e., Beech Baron, Beech Bonanza, Piper Navajo, Beech King Air and so on.

Following the conclusion of the October 2006 MPU, meetings were held between the DOA and the Aviation and Airports Advisory Board (AAAB) to discuss the results of the master plan. Recommendations resulting from decisions made during those meetings required additions to the MPU. While these specific additions were incorporated into the Executive Summary, not all revisions were carried through the entire MPU and ALP update; therefore, the final date of the documents contained in the October 2006 MPU remains unchanged. Select pages in this MPU were revised to incorporate the recommendations of the AAAB and are summarized below:

- Executive Summary; Exhibit ES-7 PHK Preferred Plan Exhibit has been replaced based on changes made to the ALP sheet replaced in it's entirety incorporating additions summarized in Addendum #1 dated March 10, 2008.
- October 2006 Technical Report No. 6; The Table of Contents was updated as a result of added text throughout the document.
- October 2006 Technical Report No. 6; Section 1.4 Runway Approach Aids and Lighting Page 1-2 – Recommendation to pursue the initiation and programming of a nonprecision GPS RNAV approach to Runway 17/35.
- October 2006 Technical Report No. 6; Section 1.9 moved to page 1-3, Page 1-3 was created as a result of added text throughout the document.
- October 2006 Technical Report No. 6; Attachment 1, The ALP sheet was replaced in it's entirety incorporating additions addressed in Addendum #1 dated March 10, 2008.

Finally, the select pages affected by these changes are marked in the MPU with a date in the footer.

Note: Exhibit has been revised to incorporate changes addressed in Addendum #1, dated March 10, 2008. Prepared by: CH2M HILL, March 10, 2008

## 1.1 Runways, Taxiways, and Apron Area

Palm Beach County Glades Airport (PHK) consists of one runway, a parallel taxiway, and a small parking apron. Runway 17/35 is asphalt-surfaced and designed to accommodate single-wheel, general aviation aircraft weighing less than 20,000 pounds. Pavement conditions described below were obtained from the Draft January 2006 Annual Airports Pavement Evaluation, prepared by Applied Pavement Technology, Inc. The current airfield layout is illustrated in **Exhibit 1-1**.

#### 1.1.1 Runway 17/35

Runway 17/35 is 4,116 feet long and 75 feet wide. Runway 17/35 is performing well, with only a moderate amount of cracking and swelling.

#### 1.1.2 Taxiway A

Taxiway A serves as the parallel taxiway to Runway 17/35 and is showing little sign of deterioration.

#### 1.1.3 Connecting Taxiways

Three small connecting taxiways; Taxiways B, C, and E, provide access between Runway 17/35 and Taxiway A. Generally, these connecting taxiways are performing well with typically only a small amount of low-severity cracking exhibited on the pavement surface.

#### 1.1.4 Taxiway D

Taxiway D extends from the east edge of the apron to the east edge of Runway 17/35. The portion extending through the apron area received a surface treatment at the same time as the apron pavement. Taxiway D is performing well, with only a moderate amount of low-severity cracking and minor surface cracking.

#### 1.1.5 Main Apron

The main apron is performing relatively well, but in comparison to the runway and taxiway facilities, it is showing signs of deterioration.

## 1.2 Fences and Security Gates

Federal regulations for general aviation airports, such as PHK, do not require a fence surrounding airport property or other sensitive aircraft operating areas. Nonetheless, perimeter fencing provides added security by minimizing vandalism of airport facilities and preventing unauthorized people and vehicles, as well as animals, from intruding on airport

Palm Beach County Glades Airport

System Wide Master Plan Study

property. In addition, loose objects on the airfield pavement can be projected by propeller and jet blast, potentially causing injury to individuals on the ramp. Therefore, a perimeter fence not only provides an added level of security, it also enhances the safety of airport operations.

A chain-link fence at PHK bounds the Airport property on the north, south, and east. Beginning at the southwestern corner of the Airport property, just east of the berm that runs parallel to Lake Okeechobee and 500 feet west of the Runway 35 end, the fence line runs southeasterly for approximately 460 feet. From that point, the fence curves to the east until it reaches the west side of Bacom Point Road. The fence continues parallel to and west of Bacom Point Road until reaching the intersection of Bacom Point Road and Airport Road. At that point, the fence runs westerly for approximately 460 feet, parallel to Airport Road before curving toward the north for 135 feet before turning west. Finally, the fence line ends east of the berm surrounding Lake Okeechobee in the northwest corner of the Airport property.

Because of the berm and ditch located along the west side of the Airport property, no perimeter fencing is installed on that side of the airfield. These manmade structures preclude intrusion onto Airport property.

There are two access gates at PHK. The main access gate is located at the entrance to the Airport, approximately 100 feet west of Bacom Point Road. This chain gate remains open during the day, but is closed at night. The second vehicle access gate is located east of the old terminal FBO building, separating the automobile parking lot from the service road that leads to the ramp. This gate usually remains open at all times. The locations of the fence and security gates are highlighted on **Exhibit 1-2**.

## 1.3 Lighting, Marking, Signage, and Other Navigational Aids

The following subsections summarize the lighting, marking, signage, and navigational aids at the Airport, as of the inventory conducted in March 2006.

#### 1.3.1 Lighting and Marking

Runway 17/35 has non-precision markings and medium intensity runway lights (MIRL) to facilitate safe operations at the Airport, and to assist pilots during poor visibility conditions. Existing pavement marking and lighting meet FAA requirements for visual and non-precision runway approaches. The MIRL system is considered to be in good condition.

The Airport is also equipped with a rotating beacon, which is located on a pole adjacent to and south of the fuel farm, approximately 240 feet southeast of the old FBO terminal building.

#### **Perimeter Fence and Security Gates**

Drawing: P:\PBIA\System Wide Airport Master Planning Study - Phase II\Task 2 - Inventory and Data Collection\Exhibits\PHK\_Inventory Exhibits.dwg\_Layout: 1-1 Fence\_Apr 26, 2006, 2:35pm

Palm Beach County System Wide Master Plan Study The primary landing aid at the Airport is a visual approach slope indicator (VASI) system installed on the left sides of the Runway 17 and Runway 35 ends. The VASI is a light system arranged to provide visual descent guidance during the approach to a runway. The system has an effective visual range of about 5 miles during the day and up to 20 miles at night. The visual glide path angle provided by Runway 17 and Runway 35 is 2.75 and 2.50 degrees, respectively.

Additionally, a lighted wind indicator with a segmented circle is provided east of Taxiway A, approximately 540 feet south of the ramp area.

The power for the airfield lighting system is provided from one electrical vault located inside of the old FBO terminal building.

#### 1.3.2 Signage

At PHK, 18 signs are installed on the airfield, including 6 runway exit signs, 6 runway holding position signs, and 6 taxiway location signs. The runway exit signs are located on the east side of Runway 17/35. The taxiway location signs are set up in combination with the runway holding position signs prior to the intersections of Taxiways A, B, C, D, and E and Runway 17/35. The signs are in good conditions and adequately located. In addition, the signs can be lighted at night or during inclement weather by pilot control.

#### 1.3.3 Other Navigational Aids

One published instrument approach exists for the Airport. The Very High Frequency Omni-directional Range (VOR) Runway 17 (VOR RWY 17) approach is considered a nonprecision approach because no vertical guidance is provided to the pilot. Lateral guidance is provided by the VOR located south of the abandoned Runway 7/25. Approximately 240 feet east of the eastern edge of Taxiway A. The VOR RWY 17 approach has a minimum descent altitude (MDA) of 580 feet above Mean Seal Level (MSL), which equates to 564 feet above the Runway 17 Touchdown Zone Elevation. A one statute mile visibility is required for Approach Category A and B aircraft. Visibility requirements increase to 1.5 miles for Approach Category C and D aircraft.

## **Aviation Tenant Facilities**

The characteristics of the general aviation facilities at PHK, as of the inventory conducted in March 2006, are described in this section. The inventory data provides the basis for determining facility requirements, which will be presented in subsequent reports. These facilities are depicted on **Exhibit 2-1**.

The Airport Layout Plan, dated September 2000, and aerial photographs of the airfield were analyzed to inventory existing general aviation facilities. A field check was also conducted on March 30, 2006, and an interview was conducted with the FBO manager. As of March 2006, four aircraft were based at the Airport, including two R-22 helicopters, and two single-engine piston aircraft.

## 2.1 FBO Terminal Building

The FBO terminal building provides approximately 1,828 square feet of space adjacent to the main apron. This building, constructed in the 1950s, was severely damaged by Hurricane Wilma in 2005, and is currently abandoned. This building cannot be rehabilitated and will have to be demolished in the future.

As of March 2006, FBO personnel and offices were housed in a trailer located along the east side of the aircraft ramp, between the old terminal building and the fuel farm. This trailer, which was purchased by the Palm Beach County Department of Airports (PBC DOA) to provide a temporary FBO facility, provides very limited space and the need for a new FBO terminal is evident. The current FBO, Pahokee Aviation, provides ramp and fueling services, as well as aircraft tie-downs.

## 2.2 Aircraft Parking and Apron Areas

The ramp provides approximately 20,000 square yards of space for based and transient aircraft parking. Thirteen tie-down positions are available on the ramp. In general, these tie-down markings are too wide for the type of aircraft that frequent the Airport. The aircraft parking area is linked to Taxiway A via two taxiway connectors that are 35 and 40 feet wide, respectively.

## 2.3 Aircraft Storage

One conventional hangar and 10 t-hangars are located at the Airport. Similar to the old FBO terminal building, these facilities were severely damaged by Hurricane Wilma and are presently abandoned.

The t-hangars are located north of the aircraft parking area and are accessible via a 20-foot wide taxilane linked to the northwest corner of the ramp. These hangars are aligned parallel

Drawing: P:\PBIA\System Wide Airport Master Planning Study - Phase II\Task 2 - Inventory and Data Collection\Exhibits\PHK\_Inventory Exhibits.dwg\_Layout: 2-1 T-Hangar\_Apr 26, 2006, 2:44pm

Palm Beach County System Wide Master Plan Study to Runway 17/35 and Taxiway A. While the foundations of the t-hangars remain in good condition, they must be demolished.

The conventional hangar offers approximately 3, 750 square feet of floor space that is currently unusable. The condition of the roof is such that people are precluded from entering the facility. Demolition of this hangar will require relocation of the electrical vault currently located at the rear of the facility.

Ancillary facilities needed to support the operations of the Airport only include a fuel farm.

## 3.1 Maintenance Facilities

There are no maintenance facilities located at the Airport. All airfield and facility maintenance services are provided by the PBC DOA Maintenance Division, which is headquartered at PBI.

## 3.2 Aircraft Rescue and Fire Fighting

The City of Pahokee provides fire-fighting support at the Airport. The nearest fire station is located north of the intersection of East and West Main Streets, in downtown Pahokee, approximately 3.4 miles from PHK.

## 3.3 Fueling Facilities

Two underground fuel storage tanks are located at the Airport, south of the main parking lot, east of the aircraft ramp and near the temporary trailer. One tank holds 15,000 gallons of AvGas (100LL), and the other holds 15,000 gallons of Jet-A fuel.

## 3.4 Airport Traffic Control Tower

At PHK, the pilots rely on communication over a Unicom frequency, as there is no Airport Traffic Control Tower located at the Airport. The Unicom frequency provides a means of communication between Airport users, as necessary.

## 4.1 Airport Access

PHK is located west of Bacom Point Road (SR 715), on the southeast corner of the Lake Okeechobee shore. Regional access is provided by the surrounding highways: US 98 to the north, US 27 and SR 80 to the south, and US 441 to the north and east. The airport is accessible by SR 715, which connects to US 441 and SR 80.

## 4.2 Airport Parking

There are a total of 14 automobile parking spaces available in the 200-square-yard parking area adjacent to the ramp and the old FBO terminal building. In addition, informal automobile parking is provided in the grassy area north of the hangar.

There are no rental car companies at this time.

## 5.1 Historic Weather Conditions

Meteorological conditions for this analysis are based on weather observations taken in the West Palm Beach area during the period 1996-2005. This data, obtained from the National Climatic Data Center (NCDC), consists of 84,031 hourly observations separated by visual meteorological conditions (VMC), instrument meteorological conditions (IMC), and "all weather" conditions as further described below. The hourly observations record data for ceiling heights, visibility, wind velocity, and wind direction, which was used to prepare wind roses for PHK, as shown in **Figures 5-1 through 5-3**.

Meteorological conditions have a direct impact on the operational characteristics of the Airport. The conditions determine directions in which aircraft operate, the frequency of use of each operating configuration, and the instrumentation required in assisting pilots in landing and departing.

#### 5.1.1 Ceiling and Visibility Conditions

Airfield and airspace capacity is impacted by the flight rules that aircraft operate under, which is governed by the ceiling and visibility conditions at the airport, due to spacing requirements.

Aircraft operate under two distinct categories of operational flight rules: Visual Flight Rules (VFR) and Instrument Flight Rules (IFR), which directly impact air traffic control procedures. These flight rules are closely related to the two categories of weather conditions: VMC (Visual Meteorological Conditions, or fair to good weather), and IMC (Instrument Meteorological Conditions, or poor weather conditions with typically poor visibility). VMC is defined as conditions in which the ceiling is at or above 1,000 feet above ground level (AGL) and the visibility is at or above three statute miles. IMC exists whenever the ceiling drops below 1,000 feet AGL and/or the visibility is below three statue miles. In the West Palm Beach area, VMC occurs approximately 99 percent of the time, and IMC occurs approximately one percent of the time.

Aircraft may operate under VFR during VMC. In these conditions, the pilot is primarily responsible for seeing other aircraft and maintaining safe separation distance; navigation is typically performed by reference to geographic and other visual references. As a result, aircraft separation requirements are reduced, increasing airspace and airfield capacity as compared to IFR.

During IMC, aircraft operate under IFR. Air Traffic Control (ATC) is primarily responsible for aircraft separation and exercises positive control over aircraft during these conditions. In order to operate under IFR conditions, pilots must be certified instrument rated and meet proficiency requirements, and aircraft must meet certain minimum equipment requirements. Navigation is typically performed by the use of radio navigational aids and vectors from ATC, in addition to the use of ATC-assigned routes and altitudes. As a result of the more stringent requirements due to limited visibility between aircraft, separation is increased during IMC which therefore reduces airspace and airfield capacity.

#### 5.1.2 Runway Wind Coverage

Aircraft arrival and departure runways are determined by wind direction, as aircraft generally takeoff and land into the wind. Due to limitations by aircraft type with regards to maximum allowable crosswind<sup>1</sup> for takeoff and landing, strong crosswinds may result in pilots having to divert to another airport if there is not a crosswind runway available.

In order to quantify crosswind, pilots and airport planners calculate crosswind components based on wind direction and speed. Each aircraft type is certified to operate within a maximum crosswind component; larger, heavier aircraft are more resistant to wind and are generally able to operate with higher crosswinds, while smaller, lighter aircraft are more subject to wind and are therefore more restricted.

The FAA recommends that airports provide at least 95 percent wind coverage for planning purposes under the limitations as defined below. If a single runway does not provide at least 95 percent wind coverage for the airport reference code (ARC), a crosswind runway should be considered. The ARC for PHK is B-II.

- → ARC A-I and B-I: 10.5-knot maximum crosswind component
- → ARC A-II and B-II: 13-knot maximum crosswind component
- → ARC A-III, B-III, and C-I through D-III: 16-knot maximum crosswind component
- → ARC A-IV through D-VI: 20-knot maximum crosswind component

**Table 5.1** summarizes wind coverage for PHK, with crosswind components of 10.5 knots, 13 knots, 16 knots, and 20 knots. **Exhibits 5-1 through 5-3** graphically show coverage during good weather (VMC) conditions, poor weather (IMC) conditions, and all-weather conditions in the form of wind roses.

Runway 17/35 provides 91 percent coverage under VMC, 90 percent coverage under IMC, and 91 percent coverage under all-weather conditions for the 13-knot crosswind component; less than the FAA recommended 95 percent coverage.

<sup>&</sup>lt;sup>1</sup> Crosswind is the velocity of wind at a right angle to the runway, calculated from the wind speed and heading in relation to the runway.

## TABLE 5.1 PHK WIND COVERAGE: VMC, IMC, and All-Weather

## SECTION 1 Airfield Demand/Capacity Analysis

The purpose of the airfield demand/capacity analysis for Palm Beach County Glades Airport (PHK) is to assess the ability (i.e., capacity) of the airfield facilities to accommodate existing and forecast aircraft operations (i.e., demand). The airfield demand/capacity was analyzed using the methodologies outlined in Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5060-5, Change 2, *Airport Capacity and Delay*. The analysis presented herein does not include delay calculations.

## 1.1 Factors Affecting Airfield Capacity

Airfield capacity is defined as the maximum number of aircraft operations that an airfield can accommodate during a specified period of time. Typically, the airfield capacity is determined for a peak-hour condition at the Airport and varies according to weather conditions, type of aircraft, airfield configuration, and air traffic control (ATC) procedures. Because PHK does not have an air traffic control tower (ATCT), an adjustment factor was considered in the analysis to account for unique conditions at such uncontrolled airports. The number and location of runway exits and the percentage of touch-and-go operations are other important factors that influence airfield capacity. These factors are discussed in the following sections.

The runway configuration at PHK consists of a single runway, Runway 17/35, and a full length parallel taxiway. The runway is oriented in a north-to-south direction, is 4,116 feet long by 75 feet wide, and has an asphalt surface.

To determine the aircraft mix index, which is a required element in determining airfield capacity, the operational aircraft fleet mix, which is based on the aircraft class, is used. **Exhibit 1-1** illustrates the aircraft classes that use PHK, as well as the typical aircraft belonging to each class. Once the class of aircraft is determined, the mix index can be calculated using the following formula: [%(C+3D)], where C and D represent the percentage of aircraft belonging to the respective classes. At PHK, the operational fleet mix consists of 95 percent Class A aircraft and 5 percent Class B aircraft. This mix is not expected to significantly change over the forecast period; therefore the mix index at PHK is 0.

Touch-and-go operations, typically performed by training aircraft, are defined as those operations during which an aircraft lands without coming to a complete stop, and immediately takes off again. As the percentage of these operations at an airport increase, the airfield capacity increases because aircraft runway occupancy time decreases, thereby allowing more aircraft to use the runway in the same amount of time. Based on discussions with the DOA General Aviation Airports Manager at PHK, 20 percent of the total operations at the Airport are estimated to be touch-and-go operations.

Source: FAA AC 150/5600-5, Change 2, *Airport Capacity and Delay.* Prepared by: Ricondo & Associates, Inc., June 2006. The number and location of runway exits, as well as their type (i.e., 90-degree angle or highspeed) are also major factors affecting an airfield's capacity. These factors collectively account for an aircraft's runway occupancy time, or the amount of time an aircraft is on a runway. For arriving aircraft, this timing is critical because an aircraft must have fully exited the runway before a second aircraft can land. Smaller aircraft typically spend less time on a runway than larger aircraft because they require a shorter distance to land, although this factor is also dependent on pilot skill, experience, and familiarity with the airfield. An example of this is if an arriving aircraft once reaching a safe taxiing speed is not near a runway exit, the aircraft must remain on the runway for a longer period of time, thereby decreasing airfield capacity. Based on this information, a greater number of exits placed at strategic locations increases airfield capacity. **Exhibit 1-2** illustrates the existing runway exits for PHK.

Weather also plays a vital role in airport capacity. In particular, weather factors, such as wind direction and velocity, cloud ceiling, and visibility, greatly affect capacity. Wind direction determines the runway configuration that can be used at any given time. Aircraft typically takeoff and land into the wind, but can accommodate a specified amount of both tailwind and crosswind. Once these winds are exceeded, an aircraft can no longer safely operate on that runway. These conditions may eliminate an airfield operating configuration with the greatest capacity, thus reducing airfield capacity.

Cloud ceiling height and visibility also affect airfield capacity. A decrease in ceiling height and/or visibility may lead to conditions in which only published instrument approaches may be flown. These conditions, known as instrument meteorological conditions (IMC) occur when the visibility is below three statute miles and/or the cloud ceiling is below 1,000 feet above ground level (AGL). Under these conditions, instrument flight rules (IFR) must be followed. The number of aircraft operating during these conditions is reduced because many private pilots are not IFR rated. At PHK, there is one published instrument approach, the very high frequency omnidirectional range/distance measuring equipment (VOR/DME) approach, which can be used in IMC. This approach has a minimum cloud ceiling height of 580 feet AGL. Based on data from the National Climatic Data Center, IMC conditions occur 0.8 percent of the time at PHK. When conditions are reduced below IMC, the airport is assumed to be closed. This occurs 0.4 percent of the time at PHK. Visual meteorological conditions (VMC) occur when visibility is greater than three statute miles and the cloud ceiling is greater than or equal to 1,000 feet AGL. When these weather conditions occur, visual flight rules (VFR) are followed, which are less restrictive than IFR. These conditions occur 98.8 percent of the time at PHK. Table 1-1 summarizes the characteristics of weather conditions and their occurrence at PHK.

| Weather Conditions | Ceiling Height (AGL)                                    | Visibility (Statute Mile)  | Percent of<br>Occurrence |
|--------------------|---|--|--------------------------|
| VFR                | 1,000 feet or above                                     | Greater than 3 statute miles   | 98.8 percent             |
| IFR                | Greater than or equal to 580 feet, but less than 1 mile | Greater than or equal to 1 statute mile, but less than 3 statute miles | 0.8 percent              |
| Airport Closed     | Greater than 580 feet                                   | Greater than 1 statute mile  | 0.4 percent              |

Airfield Demand/Capacity Analysis

For purposes of this analysis, the FAA *Terminal Area Forecast* (TAF) was not considered due to inconsistencies in historical data compared to data obtained for the Airport. As a result, a separate forecast of airport operations was derived based on updated information provided by the on-site FBO manager.

This forecast considered the average national growth rate for operations at general aviation (GA) airports (1.4 percent) obtained from the FAA *Aerospace Forecast*, dated February 2006. In 2005, the annual aircraft operations were estimated at 34,200 based on fueling operations and flight training at the Airport. In 2025, 45,163 GA aircraft operations are anticipated at the Airport. This forecast, along with the FAA TAF for 2005 is summarized in **Table 1-2**.

| Annual Operations |                   |  |
|-------------------|-------------------|--|
| Year              | May 2006 Forecast |  |
| Existing:         |                   |  |
| 2005              | 34,200            |  |
| Forecast:         |                   |  |
| 2006              | 34,679            |  |
| 2007              | 35,164            |  |
| 2008              | 35,657            |  |

TABLE 1-2

## 1.2 Airfield Demand/Capacity Analysis

Existing airfield capacity estimates are presented in terms of both hourly capacity and annual service volume (ASV). Hourly capacities were calculated for PHK under both VFR and IFR conditions. To aid in these calculations, weather data were obtained from the National Climatic Data Center, which determined airfield operating configurations. Finally, a weighted hourly capacity was determined, which is a key factor in calculating ASV.

It is important to note that the methodology for determining airfield demand/capacity presented in the FAA AC 150/5060-5 provides a theoretical airfield capacity considering a towered airfield, in which aircraft separations are strictly controlled by Air Traffic Controllers. As previously stated, PHK is an uncontrolled airfield. Thus, aircraft are not separated as expected in a controlled environment. At uncontrolled airfields, right-of-way rules and airport traffic patterns and procedures govern the operating environment for one purpose only. That purpose is to prevent collisions in the air and on the ground. Traffic separation is the primary concern. However, the above rules are based on the concept of "see and avoid." Therefore, aircraft lateral separations can vary by operators. In addition, it must be kept in mind that the airfield capacity calculation is determined for a peak-hour operating condition. When compared to the theoretical airfield capacity of a controlled airfield, it can be argued that the airfield capacity at a non-towered airport is greater than that of a controlled airfield because aircraft lateral separations are less in an uncontrolled environment. The opposing argument is that the airfield capacity at an uncontrolled airfield cannot be greater than the theoretical capacity of a controlled airfield, since it is unrealistic to imagine that all aircraft, mostly single-engine aircraft at PHK operate in an organized fashion per the non-towered airport traffic patterns and procedures. First, not all pilots are concerned with adhering to standard uncontrolled airport procedures. Second, instrument approaches present specific challengers at uncontrolled airfields. Pilots practicing instrument approaches frequently make straight-in approaches to the approach end of the active runway. This is a potentially confusing situation for VFR pilots flying a standard traffic pattern to the active runway. As previously mentioned, the only instrument approach procedure (IAP) at PHK is a VOR/DME-A approach to Runway 17.

Based on the above discussion, the airfield demand/capacity presented in this report illustrates the peak-hour theoretical airfield capacity and a calibrated airfield capacity to account for the uncontrolled airfield condition at PHK. In an effort to not overestimate or underestimate the airfield capacity at the Airport, the calibration considers a 10 percent adjustment factor below the theoretical capacity in order to reflect what actual operating conditions could be.

#### 1.2.1 Hourly Airfield Capacity

In determining the hourly airfield capacities at PHK, airfield configuration, weather conditions, aircraft fleet mix, and percentage of touch-and-go operations were considered. In addition, the various runway use configurations were considered, as well as their percent of occurrence. These capacities were considered separately for each weather condition and wind flow.

**Exhibit 1-3** illustrates the operating configurations at the Airport, as well as the percent occurrence of each; hourly capacities, and number of operations occurring during a peak hour under each operating configuration. These configurations are shown for IFR and VFR conditions, as well as for prevailing wind flow, which in this case is either south or north.

Both the theoretical and calibrated capacities are shown for each airfield operating configuration. As shown, four operating conditions occur at PHK: VFR South, VFR North, IFR South, and IFR North.

In the south flow operating configuration, both arrivals and departures use Runway 17, which occurs 55.2 percent of the time. The theoretical hourly capacity is estimated at 108 operations, while the calibrated hourly capacity is approximately 97 operations. During IFR conditions, the published instrument approach must be used for arrivals, thus decreasing the theoretical hourly capacity to 69 operations and the calibrated hourly capacity to 62 operations. IFR conditions occur 0.4 percent of the time.

In the north flow operating configuration, both arrivals and departures use Runway 35. Under VFR conditions, which occur 43.6 percent of the time, the airfield can theoretically accommodate 108 hourly operations and 97 hourly operations under calibrated conditions. During IFR conditions, arriving aircraft must use the published instrument approach to Runway 17 and circle to Runway 35. Therefore, the theoretical capacity is 69 operations per hour, while the calibrated capacity decreases to 62 operations per hour. In this configuration, IFR conditions also occur approximately 0.4 percent of the time.

#### 1.2.2 Annual Service Volume

The FAA defines ASV as "a reasonable estimate of an airport's annual capacity." The ASV calculation consists of three variables: weighted hourly capacity ( $C_w$ ), ratio of annual operations to average day-peak month operations (D), and average day-peak month operations compared to average peak hour-peak month operations (H). For PHK, these factors were estimated to be 105, 365, and 2, respectively. To determine the ASV, these three factors are multiplied together using the following equation:

#### $ASV = C_w x D x H$

This resulted in an ASV equivalent to 76,948 operations. **Table 1-3** summarizes the ASVs for PHK for the different planning horizon. In order to minimize aircraft delays, FAA recommends that airfield planning occurs once the ASV reaches 60 percent of its capacity. The ASV for PHK reaches the 60 percent threshold under the calibrated method by 2020. Thus, additional planning should be considered by that timeframe.

TABLE 1-3

PHK Annual Service Volume Comparison

Source: Ricondo & Associates, Inc., May 2006.

Prepared by: Ricondo & Associates, Inc., May 2006.

#### Notes:

<sup>1/</sup>Annual aircraft operations were forecast based on data provided by the Airport Manager and the FAA Aerospace Forecast.

<sup>2/</sup> Theoretical hourly capacities were obtained from the FAA AC 150/5060-5, *Airport Capacity and Delay*.

<sup>3/</sup> Calibrated hourly capacities were decreased by 10 percent to account for PHK being a non-towered airport.

### 1.3 Navigational Aids

Runway approach instrumentation, lighting, and other navigational aids (NAVAIDs) provide pilots with the necessary means to navigate aircraft safely and efficiently in most weather conditions. The facilities provided at PHK were described in Chapter 1 of this Master Plan Update, *Inventory*. The following navigational facilities at PHK are sufficient:

- Nonprecision approach The nonprecision approach NAVAID on Runway 17 assists aircraft performing instrument approach procedures via a very high frequency omnidirectional range (VOR).<sup>1</sup>
- ✤ Lighting and Markings Runway 17/35 has non-precision markings and medium intensity runway lights (MIRL), along with a visual approach slope indicator (VASI) system to facilitate safe operations at the Airport, and to assist pilots during poor visibility conditions.

### 1.4 Airport Design Standards

For airfield planning purposes, the ARC, along with the approach visibility minimums, directly affect the size of the surfaces associated with each runway, including the Runway Safety Area (RSA), Runway Obstacle Free Zone (OFZ), Runway Object Free Area (OFA), and Runway Protection Zone (RPZ). **Table 1-4** depicts the standard dimensions for B-II runways, along with the surface dimensions that exist for each runway at PHK. As shown, the Airport meets all criteria outlined in FAA AC 150/5300-13, Airport *Design*.

| B-II Runway Dimensional Standards |                             |                  |                    |

<sup>&</sup>lt;sup>1</sup> The VOR is considered a nonprecision approach because it does not provide vertical guidance.

### 1.5 Part 77 Surface Area

Federal Aviation Regulations (FAR) Part 77, "Objects Affecting Navigable Airspace," establishes standards for determining which structures pose potential obstructions to air navigation. This is accomplished by defining specific "Imaginary Surfaces" around an airport that should not contain any protruding objects. Objects affected include existing or proposed objects of natural growth, terrain, or construction, including equipment, which is permanent or temporary in character. Dimensions of Part 77 surfaces (primary, approach, transitional, conical, and horizontal) vary depending on the type of runway approach. These surfaces are analyzed in the Airport Plans section.

# **Ground Access and Transportation Networks**

Ground access at PHK is currently considered to be adequate. PHK is located west of Bacom Point Road (SR 715), on the southeast corner of the Lake Okeechobee shore. Regional access is provided by the surrounding highways: US 98 to the north, US 27 and SR 80 to the south, and US 441 to the north and east. The airport is accessible by SR 715, which connects to US 441 and SR 80.

# **General Aviation/Fixed Base Operator Facilities**

The GA/FBO demand/capacity analysis includes tenant facilities that serve based and transient GA aircraft, including temporary aircraft storage and/or flight support services. For purposes of this analysis, these facilities include the FBO terminal building, aircraft parking aprons, aircraft hangars, automobile parking facilities, and fueling facilities.

Currently, there is one FBO, Pahokee Aviation, Inc., at the Airport. In addition to services provided in the terminal building, Pahokee Aviation provides fueling services for the aircraft utilizing the Airport and operates the aircraft parking apron.

The effects of Hurricane Wilma in October 2005 devastated the Airport. All of the buildings, including the FBO terminal building and all of the hangars were completely destroyed. Currently, the FBO is operating out of a trailer. However, the Palm Beach County Department of Airports (PBC DOA) is planning to rebuild PHK's facilities. Thus, for the purpose of determining future facility requirements, this analysis takes into account the conditions at the Airport prior to Hurricane Wilma, which included an FBO terminal building, one conventional hangar, and 10 t-hangars.

The GA operations forecast, summarized in **Table 3-1**, was used as a basis for determining facility requirements for the Airport. In addition to the annual operations, the projected number of based aircraft is shown in Table 3-1. It should be noted that this projection of based aircraft also differs from that presented in the FAA TAF to reflect actual conditions at the Airport. The FAA TAF average annual growth for based aircraft was applied.

| Oeneral Aviation Operations r drecast |                    |        |        |        |        |

Note:

<sup>1/</sup> Based on forecast developed for PHK in May 2006 following discussions with Airport staff and FBO manager.

### 3.1 Aircraft Parking Apron

The aircraft parking apron is adjacent to the terminal building. This area encompasses approximately 180,000 square feet of space and is used to accommodate both based and transient aircraft. Based on tenant interviews, the apron area was not at capacity prior to Hurricane Wilma. Additionally, the area can accommodate more aircraft than the number of tiedown spaces currently drawn on the aircraft apron area.

Prior to Hurricane Wilma, most of the based aircraft were accommodated in hangars. For the purpose of determining future apron needs at the Airport, transient aircraft occupying the ramp in a busy day of the peak month had to be determined. Since monthly operations data were not available, an estimated 10 percent of the annual operations were used for peak month operations at the Airport. This percentage compares to the share of operations at Palm Beach International Airport during a peak month. The peak month average day (PMAD) operations were then determined by dividing the monthly operations by the average number of days in a month (31). FAA AC 150/5300-13 also recommends a 10 percent increase in the PMAD operations to account for a busy day in that month. Based on information provided in the previous Airport Master Plan, 20 percent of total operations at PHK were assumed to be transient operations. This information led to the determination of the number of transient aircraft using the apron, which was estimated to be 13 in 2005 and forecast to be 17 in 2025.

The next step in the analysis was to identify the average apron space per aircraft. The size of a large Airplane Design Group (ADG) I aircraft was taken into consideration, along with its respective object free area (OFA) taxilane clearance of 79 feet. **Exhibit 3-1** illustrates the average apron space per aircraft assumed for this analysis. As shown, this total area was determined to be 6,450 square feet per aircraft. On that basis, it was determined that the capacity of the existing 180,000 square-foot apron would be 28 tie-down positions. Based on discussions with the PBC DOA, only three based aircraft were parked on the apron prior to Hurricane Wilma. Taking into account these based aircraft, as well as the transient aircraft estimated above, the number of tie-down spaces required was determined to be 16 in 2005. Based on this demand, the total apron area resulted in less than the existing apron facility. **Table 3-2** summarizes the future apron needs through 2025. As shown, the projected number of tie-down positions are less than the capacity of the existing apron at PHK. Therefore, additional apron facilities are not anticipated at the Airport through 2025.

|                                  |         |         | Existing   |                           | _       |         |         |         |

GA/FBO Facilities Demand/Capacity

### 3.2 Aircraft Hangars

Hangar types at the Airport include t-hangars and one conventional hangar. The conventional hangar is located adjacent to the terminal building, encompassing a total of 3,750 square feet. Additionally, a row of 10 t-hangars is located north of the apron, encompassing a total of 14,000 square feet. Combined, the total hangar square footage at the Airport is 17,750 square feet. Based on discussions with Airport staff prior to Hurricane Wilma, these hangars were at capacity. **Exhibit 3-2** illustrates the existing hangars (prior to Hurricane Wilma) at PHK.

Based on discussions with the PBC DOA, 10 aircraft were stored in the hangars prior to Hurricane Wilma. This number was forecast to increase to 17 based aircraft in 2025. By comparing the existing total hangar area (17,750 square feet) to the number of hangared aircraft (10), it was estimated that a gross area of 1,775 square feet would be required for each hangared aircraft. As such, the total hangar area required for 2025 representing an increase of approximately 70 percent from existing conditions is expected to increase to 30,175 square feet. **Table 3-3** summarizes the hangar facility requirements.

#### TABLE 3-3 Facilities Requirements Summary

### 3.3 Automobile Parking Areas

The main automobile parking area associated with the hangar facilities is located north of the conventional hangar, occupies an area of 1,650 square feet, and encompasses a total of five parking spaces. The requirement for automobile parking areas associated with the hangars was analyzed by determining a ratio of the total associated parking area compared to the total hangar area square footage. The results of this analysis are summarized in **Table 3-4**. As shown, the parking area will increase by approximately 70 percent in 2025, which corresponds to an additional four parking spaces.

TABLE 3-4

### 3.4 Fueling Facilities by Type

The demand/capacity assessment for the fueling facilities at PHK, which are operated by Pahokee Aviation, was conducted to determine if an adequate supply of fuel would be available onsite in the event of a supply disruption. This supply capacity was then compared to the industry-standard, three-day fuel supply to determine any potential deficiencies.

Historical fuel flowage data was obtained from the PBC DOA. The flowage was segregated by fuel type (Jet-A vs. AvGas) based on information provided by the Airport Manager. Additionally, the capacity of the existing facilities was determined, as well as the existing and forecasted aircraft operations. Aircraft operations were based on the forecast developed for PHK in May 2006. This combined information provided a basis from which a ratio of fuel demand per operation was determined. The ratio allowed for the fuel demand to be forecast over the planning period, which was then converted into a projected fuel supply by comparing the existing capacity and annual fuel demand. This fuel supply was finally converted into days for comparison with the typical three-day supply. **Table 3-5** on the following page summarizes the fuel demand/capacity analysis for the Airport. As shown, the supplies for both Jet-A fuel and AvGas are projected to be well above the typical threeday supply through the forecast period. Therefore, the current fueling facilities at the Airport are expected to be adequate to meet the Airport's needs over the forecast period.

#### TABLE 3-5

Fuel Facility Demand-Capacity Assessment

|  | Jet A <sup>1/</sup> | AvGas <sup>1/</sup>   |

Notes:

<sup>17</sup> Assuming 30 percent of FBO customers use Jet-A fuel and 70 percent use AvGas based on interview with FBO manager. <sup>27</sup> Accounts for 20 percent touch-and-go operations based on information obtained through tenant interviews.

<sup>37</sup> Estimated 2005 annual fuel demand based on data obtained through the Palm Beach County Department of Airports and tenant interviews.

<sup>4/</sup> General aviation forecast reflects national general aviation airport growth rate. <sup>5/</sup> Typically, a three-day capacity is recommended.

# **Other Airport Support Facilities**

Support facilities provide services to the airport and the aircraft serving the airport. At GA airports, these facilities typically include aircraft rescue and fire fighting (ARFF) facilities and airport maintenance.

FAR Part 139 requires an ARFF station at commercial service airports. However, ARFF stations are not required at GA airports, such as PHK, where aircraft rescue and fire fighting services are provided by the City of Pahokee. This fire station is located in downtown Pahokee. Airport maintenance is the responsibility of the PBC DOA. Since there is not a need for a maintenance facility on Airport property, none is anticipated to be located at the Airport.

| 2-1 | Environmental Impact Summary                       | 2-2 |  |
|-----|--|-----|--|
| 3-1 | Required Permits/Actions for the Proposed Measures | 3-2 |  |

### section 1 Introduction

The purpose of this chapter is to provide an overview of potential environmental impacts associated with long-term development identified in this Master Plan Update. The environmental resources evaluated include those typically considered by the National Environmental Policy Act (NEPA) and Federal Aviation Administration (FAA) Orders 5050.4B, *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions* (April 2006), and 1050.1E, *Environmental Impacts: Policies and Procedures* (March 2006). **Section 2** of this chapter provides an **overview of potential impacts** to the environment that could result from the proposed projects at Palm Beach County Glades Airport (PHK). **Section 3** provides a **summary of permits and mitigation** that may be required for construction and operation of the proposed improvements.

This qualitative impact analysis is based on current information. Prior to FAA approval for the projects recommended in this Master Plan Update, further evaluation of the impacts to identified resources will need to occur. Impacts to each of the environmental resources categories were evaluated within a **study area of one-half mile from the airport boundary** based on the Palm Beach County Glades Airport Environmental Constraints Inventory (CH2M HILL, 2005), as well as state and county websites.

### SECTION 2 Environmental Impacts

The projects proposed and evaluated for impact at PHK include:

- ✤ Replacement of Visual Approach Slope Indicator (VASI) systems with Precision Approach Path Indicator (PAPI) systems and installation of Runway End Identifier Lights (REIL) on both ends of Runway 17/35;
- ✤ Construction of a new terminal, conventional hangar and 10-unit T-hangar to replace facilities damaged in the 2004-2005 hurricane season;
- ✤ Construction of a new 10-unit T-hangar west of the existing T-hangar;
- ✤ Development of additional vehicle parking to meet future parking demands;
- → Expansion of current apron to the south by 53,000 square feet;
- ✤ Avigation easements for properties within the Runway 17/35 Runway Protection Zones (RPZ) for parcels that will not be acquired in fee simple; and
- → Property Acquisitions in fee simple for properties with the Runway 17/35 RPZs.

Implementation of these projects may result in impacts to three resource categories. Table 2-1 summarizes all of the environmental resource categories and potential project impacts.

### 2.1 Compatible Land Use

Until recently, existing land uses to the north and south were not compatible with current FAA requirements for the Runway Protection Zones (RPZ) off Runway 17/35. Fee simple acquisition of these properties has taken place in the recent past and plans are underway to demolish the existing structures in order to make all land use within the RPZ compatible. To prevent future incompatible land use, avigation easements are proposed to control land use on properties within the RPZ that are currently compatible.

### 2.2 Hazardous Materials, Pollution Prevention and Solid Waste

Depending on prior and existing land uses, evaluation for hazardous materials, asbestos, lead-based paint, contaminated soils and underground storage tanks should be completed on the acquired properties prior to building demolition.

# 2.3 Socioeconomic Impacts, Environmental Justice, and Children's Environmental Health and Safety Risks

For properties acquired at the north and south end of the airport, analyses will need to be completed to evaluate whether demolition of the four residences would place a disproportionately high and adverse impact on low-income or minority communities. Regardless of the income or minority status of residents, relocations must occur in accordance with the Uniform Relocation and Real Property Acquisition Policies Act of 1970, as amended.

| Environmental Category   | Resources in Study Area and Impacts Identified   |
|--|--|
| Air Quality  | In attainment area. Proposed projects will not generate additional aircraft or vehicle traffic; therefore, no increase in or impacts from emissions due to proposed projects.  |
| Coastal Resources  | Within state coastal zone boundary. Consistency determination required.  |
| Compatible Land Use  | Structures (recently acquired) within RPZ at both ends. Demolition of<br>structures and relocation of individuals and/or businesses requires<br>additional analyses and adherence to Uniform Relocation and Real Property<br>Acquisition Policies Act.   |
| Construction Impacts   | Demolition and reconstruction of terminal building and hangars damaged by<br>hurricanes. Demolition of structures on properties to be acquired in RPZ.<br>Structures to be demolished require inspection for asbestos, lead-based<br>paint, hazardous materials and so on; if found, specific demolition and<br>disposal procedures are triggered. |
| Department of Transportation Act,<br>Section 4(f)                      | One county park (Duncan Padgett Park) northeast of the airport and east of SR 175. A portion of the 110-mile-long Lake Okeechobee Scenic Trail, a segment of the Florida National Scenic Trail, along the west side of the airport atop Herbert Hoover Dike. No impacts to 4(f) resources are foreseen.  |
| Farmlands  | Present to east and south of airport. No impacts foreseen.   |
| Fish, Wildlife and Plants  | Potential habitat for Bald Eagle (federal and state threatened) and<br>Okeechobee gourd (federal and state endangered species) exists near the<br>airport but not on airport property. Coordination with U.S. Fish and Wildlife<br>Service and FL Fish and Wildlife Conservation Commission required in<br>NEPA process.                           |
| Floodplains  | Located within the limits of the 500-year floodplain (Zone B). No impacts foreseen.  |
| Hazardous Materials, Pollution<br>Prevention and Solid Wastes          | Demolition of terminal building and hangars damaged by hurricanes.<br>Demolition of structures on properties to be acquired in RPZ. Structures to<br>be demolished require inspection for asbestos, lead-based paint, hazardous<br>materials, underground tanks and so on; if found, specific demolition and<br>disposal procedures are triggered. |
| Historical, Architectural,<br>Archeological, and<br>Cultural Resources | Herbert Hoover Dike (surrounds Lake Okeechobee) is NHRP eligible, but will not be impacted. Coordination with State Historic Preservation Officer (SHPO) required as integral part of NEPA process.  |
| Light Emissions and Visual Impacts                                     | None anticipated.  |
| Natural Resources and<br>Energy Supply                                 | None anticipated.  |

TABLE 2-1 Environmental Impact Summary

| Environmental Category   | Resources in Study Area and Impacts Identified  |
|--|---|
| Noise  | Proposed projects will not generate additional aircraft or vehicle traffic; therefore, no impacts from noise due to proposed projects anticipated.  |
| Socioeconomic Impacts,<br>Environmental Justice and<br>Children's Environmental Health<br>and Safety Risks | Recent property acquisition to north and south of properties with structures within the RPZ is noted, as well as future plans to acquire avigation easements for other properties within RPZ that will not be acquired in fee. Relocation of individuals and/or businesses requires additional analyses of disproportionate economic/racial impacts and adherence to Uniform Relocation and Real Property Acquisition Policies Act.   |
| Water Quality  | Lake Okeechobee to the west is a resource for drinking water, irrigation and recreation regulated by the U.S. Army Corps of Engineers. The airport is located in the streamflow and recharge zones of the Biscayne sole source aquifer. Coordination with the Corps, the S. FL Water Management District and the U.S. Environmental Protection Agency required through the NEPA process. Given nature of proposed development, Best Management Practices should prevent any damage to the identified resources. |
| Wetlands   | Riverine and palustrine emergent wetlands are present southwest of airport, but will not be impacted.   |
| Wild and Scenic River  | None present in study area.   |

### 3.1 Further NEPA Processing

It is recommended that the proposed development program be assessed under a single Environmental Assessment (EA) prepared in accordance with FAA Orders 5050.4B and 1050.1E. This all-inclusive approach presents economies of scale for DOA and enables the cumulative impacts, if any, of the projects to be assessed at one time. Also, the EA process would trigger consultation/coordination with various agencies and authorities where conceptual mitigation plans and proposals could be aired and assessed. As early mitigation planning and permitting are proven means of expediting projects, it is recommended that the EA process also include elements of both.

### 3.2 Mitigation

The proposed developments at PHK present little likelihood of environmental impact, and that foreseen is mitigated readily. For the most part, potential impacts are foreseen around the recent acquisition of properties within the RPZ at both runway ends. Prior to demolition (which relates also to the demolition of the existing terminal, hangar and T-hangar complex damaged in the 2004-2005 hurricane season), the structures should be assessed for the presence of asbestos, lead-based paint, mercury light ballasts, hazardous wastes and so on, with the demolition specifications reflecting the appropriate and approved demolition and disposal methodologies. Similarly, any individuals and/or businesses displaced must be compensated in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended.

Given the nearby presence of Lake Okeechobee and the fact that the airport sits astride the streamflow and recharge zones of the Biscayne sole source aquifer, coordination with the U.S. Army Corps of Engineers, the South Florida Water Management District and the U.S. Environmental Protection Agency is advised.

### 3.3 Permitting

### SECTION 1 Overview

The previous chapter, *Demand/Capacity and Facility Requirements*, determined the facilities needed at Palm Beach County Glades Airport (PHK) based on projected aviation demand over the 20-year planning period (through 2025). The purpose of this chapter is to review and verify the validity of previously evaluated alternatives from the most recent Master Plan<sup>1</sup> to ensure the preferred alternative previously selected still represents the best way to reasonably satisfy future aviation-related demand.

In order to review, validate, and potentially adjust the previously selected preferred alternative, the forecast requirements and demand/capacity assessment from the previous Master Plan is compared to those of the current effort. Ultimately, the preferred facility development alternative will serve as the basis for the future Airport Layout Plan (ALP).

To that end, the alternatives analysis discussion is contained in the following sections:

- ✤ Comparison/Summary of the Forecast Reports
- ✤ Comparison/Summary of the Demand/Capacity and Facility Requirements Analyses
- ✤ Review of Alternatives and Preferred Alternative

<sup>&</sup>lt;sup>1</sup> Dames and Moore, *Master Plan Update for Palm Beach County Glades Airport,* 2001.

A comparison of the forecasts of based aircraft and aviation operations for PHK between the 2001 Master Plan Update and this Master Plan Update are provided below.

### 2.1 Based Aircraft

Between master planning efforts, there were not any dramatic changes in the number of based aircraft projections for PHK. This comparison is shown in **Table 2-1**.

TABLE 2-1 Based Aircraft Comparison, 2001 Forecast and 2006 Forecast 2006 Forecast 2/ 2001 Forecast <sup>1/</sup> Number of Number of Year Aircraft Year Aircraft Existing Year of Study: Existing Year of Study: 1999 2005 13 13 Forecast Years: Forecast Years: 2004 14 2005 14 --2009 16 2009 14 2010 16 2010 14 2014 18 2014 15 2015 15 2015 18 2019 20 2019 16 2020 16 \_ 2025 17

*Italic Font*: Based aircraft data extrapolated for comparison purposes. Prepared by: CH2M HILL, October 2006.

<sup>1/</sup> Source: Dames and Moore, *Master Plan Update for Palm Beach County Glades Airport*, 2001.

<sup>2/</sup> Source: PBC DOA/Ricondo & Associates, May 2006. (Based on the FAA Aerospace Forecast, February 2006).

The number of based aircraft in 1999 for the previous Master Plan Update was 13. This number was projected to increase to 20 by 2019. As shown in the current forecast, the existing number of based aircraft in 2005 remained at 13, and is projected to increase to 17 over the planning period, through 2025. This is slightly less than the projected 20 based aircraft through 2019, as estimated by the previous forecast.

### 2.2 Airport Operations

The two forecasts of annual aircraft operations are shown in Table 2-2.

| 2001 F        | orecast <sup>1/</sup> | 2006 Forecast <sup>2/</sup> |                       |  |

#### TABLE 2-2 Annual Aircraft Operations Comparison, 2001 Forecast and 2006 Forecast

*Italic Font*: Aircraft operations data extrapolated for comparison purposes. Prepared by: CH2M HILL, October 2006.

<sup>1/</sup> Source: Dames and Moore, *Master Plan Update for Palm Beach County Glades Airport*, 2001.
 <sup>2/</sup> Source: PBC DOA/Ricondo & Associates, May 2006. (Based on the FAA

Aerospace Forecast, February 2006).

The 2001 Master Plan Forecast projected a significantly higher growth rate for PHK (2.1 percent per year), than that of the current forecast (1.4 percent per year). The 2001 Forecast estimated that by 2005, operations would be 41,205, which is actually 18 percent higher than actual levels in 2005. The resulting number of aircraft operations over the planning period is 45,163 for 2025, which is still approximately 20 percent lower than the forecast number of operations for the previous planning period, which projected through 2019.

## **Comparison/Summary of Demand/Capacity and** Facility Requirements Analyses

This section summarizes the requirements for the airfield and general aviation (GA)/Fixed Based Operator (FBO) facilities identified in the *Demand/Capacity and Facility Requirements* chapter.<sup>2</sup> As the purpose of this chapter is to review and verify the validity of previously evaluated alternatives, this section also provides a comparison of the facility requirements identified in the 2001 Master Plan Update.

### 3.1 Airfield Facilities

In the previous chapter, airfield capacity was analyzed to assess whether PHK's existing runway system will experience a capacity deficiency over the planning period. A summary of the findings from the previous chapter, as well as from the previous Master Plan, is provided in **Table 3-1**.

TABLE 3-1 Comparison of ASV

|                              | 2001 Master Plan <sup>1/</sup> |         | Current Mas | Current Master Plan <sup>2/</sup> |  |

Prepared by: CH2M HILL, October 2006.

<sup>1/</sup>Source: Dames and Moore, Master Plan Update for Palm Beach County Glades Airport, 2001.

<sup>2/</sup> Source: CH2M HILL and Ricondo & Associates, Demand/Capacity and Facility Requirements, Oct. 2005.

In the 2001 Master Plan, the projected ASV is much higher than that of the current Master Plan. The methodology used in the previous Master Plan to ascertain ASV was not documented, so it is not known how that level of ASV was estimated. The methodology used for this effort is described in the previous chapter. Even with the significantly lower ASV determined in this Master Plan, no additional capacity will be needed before the end of the planning period.

<sup>&</sup>lt;sup>2</sup> As described in the previous chapter, prior to Hurricane Wilma, facilities at the Airport included an FBO terminal building, a conventional hangar, and 10 t-hangars. The future facility requirements were calculated assuming those facilities are rebuilt and used as existing.

### 3.2 GA/FBO Facilities

For GA/FBO facilities, the demand/capacity analysis concluded that additional facilities are required for aircraft hangars and automobile parking by 2025. Both the previous Master Plan demand/capacity analysis and this analysis concluded that the FBO terminal building, aircraft apron, and other support facilities, including ARFF, maintenance, and fuel facilities, are adequate through the planning period. As noted, most of the existing facilities were destroyed in 2005 by a hurricane. This analysis serves to help determine the appropriate replacement facilities over the planning period.

**Table 3-2** provides a summary of the GA/FBO facility requirements.

| 2025 GA/FBO Facility Requirements Summary (square feet) |                                      |                     |           |
|---|--------------------------------------|---------------------|-----------|
| Facilities  | Existing<br>Facilities <sup>1/</sup> | 2025<br>Requirement | Shortfall |
| Terminal Building/FBO                                   | 1,828                                | 1,828               | -         |
| Aircraft Apron  | 180,000                              | 135,450             | -         |
| Hangar Facilities                                       | 17,750                               | 30,175              | (12,425)  |
| Auto Parking <sup>2/</sup>                              | 1,650                                | 2,850               | (1,200)   |

Notes:

TABLE 3-2

1/ Based on the existing facilities at the airport prior to the hurricane.

2/ Only represents the automobile parking associated with hangar facilities.

### 3.3 Ground Access and Transportation Networks

Ground access needs are being assessed as a part of a separate planning effort to be completed in the near future (MTP Group, Inc., *Ground Access and Transportation Networks*, estimated to be complete in November 2006). However, ground access at PHK is currently considered to be adequate. PHK is located west of Bacom Point Road (SR 715), on the southeast corner of the Lake Okeechobee shore. Regional access is provided by the surrounding highways: US 98 to the north, US 27 and SR 80 to the south, and US 441 to the north and east. The airport is accessible by SR 715, which connects to US 441 and SR 80.

# Review of Alternatives

The purpose of the review of alternatives is to determine if the preferred alternative presented in the 2001 Master Plan will adequately meet the projected 2025 demand levels, and represent the best way to do so. Considering operations and based aircraft are actually lower in this Master Plan versus the 2001 Master Plan, the alternative identified in the 2001 Plan will not require any adjustments to satisfy the needs outlined above.

#### 2001 Preferred Alternative

Alternative 2 was chosen as the recommended alternative in the 2001 Master Plan. This alternative, developed to meet the needs of the Airport in the 2001 Dames and Moore Master Plan, also satisfies the capacity needs projected in the current demand/capacity analysis. Due to the reduction of forecast operations and based aircraft, all of the facilities on the airport layout plan still meet the requirements through the updated planning horizon. No better alternatives exist, and this alternative remains the preferred plan for 2025 development.

**Exhibit 4-1** is provided on the following page to provide better detail of the GA/FBO facilities required. As shown, a row of t-hangars, encompassing a total of 14,170 square feet is proposed east of the existing t-hangars, and north of the apron. The automobile parking spaces required are accommodated north of the conventional hangar and access road, replacing the existing unpaved lot.

| 12 | Sensitivity Analysis 212-1  |  |  |
The financial viability of implementing the Master Plan recommendations for the Airport and its three reliever airports collectively known as the Airport System is discussed in this chapter. As noted previously, the actual implementation schedule for the various improvements identified in the Master Plan will be defined by development triggers and demand growth rather than specific calendar years. For purposes of this illustrative financial analysis, a specific implementation schedule was assumed; however, it should be noted that this schedule and the resulting financial analysis are intended only to demonstrate financial viability and that the actual financing strategies used will be determined as implementation approaches. The projected financial results are presented in detail for the short term, Fiscal Year (FY) 2007 through FY 2017, and a more general overview is presented for the longer term of the Master Plan period, FY 2018 through FY 2025 (for Fiscal Years ending September 30). This chapter is presented in the following sections:

- I. Financial Structure of the Airport
- II. Capital Improvement Plan Phasing and Funding Sources
- III. Debt Service Requirements
- IV. Operation and Maintenance (O&M) Expenses
- V. Airport Revenues (Airline and Nonairline)
- VI. Cost per Enplaned Passenger
- VII. Cash Flow
- VIII Debt Service Coverage
- IX. Summary of Baseline Scenario
- X. Sensitivity Analysis 1
- XI. Sensitivity Analysis 2

# 2.0 Financial Structure of the Airport

This section presents a discussion of the Airport System's accounting practices, a summary of the Airport-Airline Use and Lease Agreement (the Airline Agreement) between Palm Beach County and the airlines that have executed the Airline Agreement (the Signatory Airlines), and the Bond Resolution that was adopted in 1984 and subsequently amended in full.

# 2.1 Accounting Practices

Airport System-related expenditures are categorized by type of expense into Direct Cost Centers and Indirect Cost Centers, as defined in the Airline Agreement. Revenues are allocated in the same manner. Direct Cost Centers include those areas or functional activities of the Airport System used for the purposes of accounting for Revenues, O&M Expenses, and Debt Service. Revenues are not usually associated with Indirect Cost Centers, which include those areas or functional activities of the Airport System used to account for O&M Expenses and Debt Service. The expenses included in Indirect Cost Centers are allocated to Direct Cost Centers as defined in the Airline Agreement.

Direct Cost Centers defined in the Airline Agreement include, but are not necessarily limited to:

- Airside Includes all Debt Service, all Direct and Indirect O&M Expenses, Capital Expenditures, and Operating Revenues for the Airside. The Airside includes the landing area, taxiways and Ramp Area.
- **Terminal** Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for the Terminal, which consists of airline terminal facilities at the Airport.
- **Tenant Equipment** Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues related to loading bridges, aircraft supply systems, holdroom furnishings, and certain bag makeup and bag claim equipment.
- **Ground Transportation** Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for terminal access roadways (including the enplanement/deplanement drives), all Airport roads, Airport parking facilities, and other areas and facilities accommodating ground transportation.
- Aviation Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for air cargo, general aviation, flight kitchen, and military activities.
- Non-Aviation Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for Airport areas related to non-aviation purposes that provide support functions

(e.g., rental car maintenance areas, and miscellaneous ground areas and facilities leased by Airport tenants).

• **Terminal FIS** - Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for Airport areas related to areas in the Terminal, and/or elsewhere on

the Airport, to be used by agencies of the United States Government for the inspection of passengers and their baggage, and for the exercise of the responsibilities of said agencies with respect to the movement of persons and property to and from the United States.

- **Palm Beach County Park (Lantana Airport)** Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for all activities and facilities at Lantana Airport.
- **Palm Beach County Glades Airport (Glades Airport)** Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for all activities and facilities at Glades Airport.
- North Palm Beach County General Aviation Airport (North County Airport) Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for all activities and facilities at North County Airport.
- Air Cargo Building Includes all Debt Service, all Direct and Indirect O&M Expenses, and Operating Revenues for all activities at and facilities surrounding the Air Cargo Building.

Indirect Cost Centers defined in the Airline Agreement include, but are not necessarily limited to:

- Administrative and Operations Includes all Direct O&M Expenses for all administration activities and facilities, including charges for County administrative services provided on behalf of the Airport System (e.g. accounting, finance, data processing services). Administrative O&M Expenses are allocated based on each Direct Cost Center's share of O&M Expenses attributable to all Direct Cost Centers.
- **Maintenance** Includes all Direct O&M Expenses for maintenance activities and facilities of the Airport System. Maintenance O&M Expenses are allocated to Direct Cost Centers to the extent possible based on actual staff hours charged to each respective Direct Cost Center, and other O&M Expenses that can be directly charged.
- **Fire Department** Includes all Direct O&M Expenses for fire, and rescue activities and facilities, including those required under FAR Part 139. Fire department O&M Expenses are allocated to Direct Cost Centers to the extent possible based on actual staff hours charged to each respective Direct Cost Center, and other O&M Expenses that can be directly charged.

# 2.2 Airline Agreement

The County recently negotiated a new Airline Agreement, effective October 1, 2006, with a five year term. The rate-making structure for FY 2007 through FY 2015 includes the following key elements:

- A "compensatory" average rental rate for the Terminal, using total rentable square feet as the divisor. Differential Terminal rental rates are calculated for the purpose of differentiating space by location and function.
- A "residual" landing fee rate for the Airside using total landed weight as the divisor.

- A revenue-sharing provision, by which a portion of funds remaining after the payment of debt service, O&M expenses and replenishment of required fund balances, equivalent to 50 percent, is credited to the Signatory Airline rate base in the subsequent year.
- There is no majority in interest provision in the Airline Agreement for any capital projects at the Airport.

# 2.3 Bond Resolution

The Bond Resolution authorizes the issuance of Airport System Revenue Bonds by the County. The requirements of the Bond Resolution and the methodology contained in the Airline Agreement were adhered to in developing the application of revenues included in these financial analyses. The principal funds and accounts created in the Bond Resolution are summarized below:

- Revenues (or "Operating Revenues") as defined in the Bond Resolution, include, generally, all revenue due and payable to the County from the ownership or operation of the Airport System, including all rentals, concession revenue, use charges, and landing fees.
- An O&M Reserve requirement was established in an amount equal to one-sixth of the amount appropriated in the annual budget for O&M Expenses for the then-current Fiscal Year.
- Pursuant to the Bond Resolution, the County covenants that it will fix, charge, and collect rates, fees, rentals, and charges for the use of the Airport System, and shall revise such rates, fees, rentals, and charges as often as may be necessary or appropriate to produce Revenues in each Fiscal Year at least equal to the sum of Operation and Maintenance Expenses, including reserves therefore provided for in the annual budget, plus the greater of (a) an amount equal to the sum of 1.25 times the Aggregate Debt Service for such Fiscal Year, or (b) the sum of (i) the amount to be paid during such Fiscal Year into the Debt Service Account, plus (ii) the amount, if any, to be paid during the Fiscal Year into the Debt Service Reserve Account (including amounts payable to the issuer of any Debt Service Reserve Account Facility and excluding amounts required to be paid into such account out of the proceeds of Bonds), plus (iii) the amount, if any, to be paid into the Renewal and Replacement Fund as provided in the Annual Budget, plus (iv) all other charges and liens whatsoever payable out of Revenues during such Fiscal Year, plus (v) to the extent not otherwise provided for, all amounts payable on Subordinated Indebtedness.

# 3.0 Capital Improvement Plan – Phasing and Funding Sources

This section presents a discussion of the Master Plan's long-term Capital Improvement Plan (CIP) including discussion of major projects and funding sources.

# 3.1 Projects

Funding for the CIP is expected to be secured from various sources. The estimated capital costs were developed in current dollars and escalated to inflated dollars using an annual growth rate of five percent. **Table 1.1** presents the CIP by Airport by funding source. The CIP is estimated to cost \$922.1 million in inflated dollars, and consists of the following projects:

- Airside projects in the CIP are estimated to total approximately \$390.2 million.
- Terminal improvements are estimated to total \$75 million and include redevelopment of Concourse A, expansion of Concourse C, and construction of a new baggage system.
- A new parking garage for the Airport is planned for FY 2023 at an estimated cost of \$224 million.
- A cargo facility is planned for FY 2015 at an estimated cost of \$33 million.
- Projects at the general aviation airports are planned as follows:
  - Lantana Airport \$23 million
  - North County Airport \$26 million
  - Glades Airport \$5 million

# 3.2 Funding Sources

The County intends to finance the recommended CIP through a combination of FAA Airport Improvement Program (AIP) grants (entitlements and discretionary), Florida Department of Transportation (FDOT) grants, passenger facility charge (PFC) revenues, County funds, and proceeds from the sale of General Airport Revenue Bonds (GARBs). The County has been actively seeking maximum discretionary funding for certain Airfield projects and may pursue an FAA Letter of Intent (LOI) for certain Airfield projects. **Table 1.2** presents the CIP for FY 2007 through FY 2025 and funding sources for each project. For purposes of this report, funding sources have been identified on the basis of project eligibility and are presented as a Base Case. Actual funding may not be secured at this level of eligibility and alternative funding scenarios are presented later in the chapter. The following sections briefly describe the anticipated funding sources for these projects.

#### Table 1.1 (1 of 2)

Capital Improvement Plan – Summary of Funding Sources

|   |                   |               |              | Funding Source |              |               |

#### 3.2.1 AIP Grants

One of the main sources of funding for airport improvements is the federal AIP. The AIP was initially authorized by the Airport and Airway Improvement Act of 1982 to assist airport sponsors in funding planning, development, and noise compatibility projects at public-use airports nationwide to accommodate projected civil aviation growth. To be eligible for funding assistance under this 1982 act, an airport must be included in the National Plan of Integrated Airport Systems (NPIAS).

The AIP is funded through the Aviation Trust Fund, which was established by the Airport and Airway Revenue Act of 1970. Revenues for the Aviation Trust Fund are derived through the levying of taxes and fees on aviation fuel and lubricants, airline tickets, international departing passengers, aircraft freight, and other components of the aviation industry. Funds deposited into the Aviation Trust Fund are distributed to eligible airports throughout the United States and its territories through grants administrated by the FAA under appropriations limits established by the United States Congress.

The FAA allocates funds to the nation's airports based on a number of eligibility criteria tied to a priority system used to rank each request and determine which projects will be funded and which will not during any given federal fiscal year (also ending September 30). The priority system used by the FAA is based on different criteria for different types of projects. Generally, projects that enhance the safety of aircraft operations and those that enhance capacity in the national air transportation system are higher priority projects. Projects are also ranked based on the size of the airport and the number of aircraft and aircraft operations at the facility.

The County has assumed that approximately \$333.1 million of projects are eligible for AIP funding (discretionary and entitlements), including the extension and relocation of Runway 9R-27L at Palm Beach International Airport. The County intends to pursue an LOI for the airfield projects that comprise the Airfield Improvement Projects. As the runway and other airfield improvements will significantly enhance the capacity of the national air transportation system, the runway and associated airfield projects are ideally suited for LOI funding. The proposed runway project is expected to be economically justifiable with a positive net present value and a benefit-cost ratio significantly greater than 1.

## 3.2.2 FDOT Funds

Similar to the federal AIP, the FDOT Aviation Grant Program is funded from the State Transportation Trust Fund. The State Transportation Trust Fund consists, in part, of funds collected through the State's aviation fuel tax. The FDOT Aviation Office administers the aviation grant program to help provide a safe, cost-effective, and efficient Statewide aviation system. The FDOT Aviation Grant Program supplements the AIP, providing a portion of the sponsor's matching share when federal funding is available and up to 80 percent of the overall project cost when it is not. FDOT grant funds help airport sponsors to construct T-hangars, construct and maintain runways and taxiways, eliminate airport hazards, protect the airspace, and construct terminals and other facilities.

All publicly owned Florida airports that are open for public use are eligible for State funding. In addition, privately owned airports that are classified as "reliever" airports are eligible for FAA funding. Florida law generally allows FDOT to fund any capital project on airport property and any service that leads to capital projects, such as planning and design services. The only off-airport projects eligible for FDOT funding are the purchase of lands for mitigation purposes, the purchase of avigation easements, and the access projects for intercontinental airports. Airport capital equipment is eligible, except equipment closely related to day-to-day operations (mowing machines, weed eaters, airport vehicles, etc.). In general, operational expenses, such as for maintenance services, equipment, and supplies, are not eligible for FDOT aviation grants. To be eligible for FDOT grants, each airport project must be consistent with the airport's role as defined in the Florida Aviation System Plan (FASP), and capital projects must be part of an FDOT approved airport master plan or airport layout plan. Additionally, for projects to be eligible for State funding, they must also be included in the Joint Automated Capital Improvement Plan (JACIP). Under this plan, the State accepts requests from airport sponsors for project funding along with each airport sponsor's priority for individual airport projects. Inclusion in the JACIP does not represent a commitment by the FDOT or FAA to fund a particular project or projects. The JACIP is intended to coordinate State and federal funding efforts and provide a realistic approach to funding based on the best and most current information available regarding projects at Florida grant-eligible airports.

FDOT grants are expected to fund approximately \$117.6 million of the Master Plan projects.

## 3.2.3 Passenger Facility Charge Revenues

In accordance with the Aviation Safety and Capacity Expansion Act of 1990, as amended by the Aviation Investment and Reform Act for the 21st Century (AIR-21), the County recently filed a PFC application to impose a \$4.50 PFC at the Airport. PFC revenues may be used to fund the local share of eligible Airport project costs (PFC eligibility for projects generally follows the same general guidelines for determining AIP grant eligibility outlined earlier).

In June 2007, the County filed a PFC Application to collect PFC at a \$4.50 level, which is expected to be approved and will become effective May 1, 2008. The County is therefore, required by AIR-21 to demonstrate to the FAA that the project will make a significant contribution to improving air safety and security, increasing competition among air carriers, reducing current or anticipated congestion, or reducing the impact of aviation noise on people living near the Airport. The finding of significant contribution is in addition to the finding of adequate justification already required for all PFC-eligible projects. In particular, the FAA considers all relevant factors, including but not limited to the following, in assessing whether the significant contribution requirement has been met:

- *Safety and security projects.* Does the project advance airport safety and/or security? In the case of AIP discretionary funds, highest priority is usually given to those projects that meet regulatory requirements for safety and security under 14 CFR Part 139 and Part 107, respectively. A similar approach to assessing PFC significance may be appropriate.
- *Congestion (capacity).* Does the project support or is it part of a capacity project to which the FAA has allocated federal resources or that would qualify for such resources? For example, is the project included in an LOI or does it satisfy the FAA's benefit-cost criteria for large AIP discretionary investments? Has the project been identified as an important item in an FAA Airport Capacity Enhancement Plan? Does the project alleviate an important constraint on airport growth or service?
- *Noise.* Does the project affect the noise-impacted areas around the airport? Historically, higher priority for AIP discretionary grants has been given to projects in noisier areas over

projects in less noisy areas, all other factors being equal. A similar approach to assessing PFC significance may be appropriate.

• *Competition.* Does the project mitigate or remove barriers to increased airline competition at the airport? Has the project been identified as an essential component in the airport's competition plan or other similar documents?

When submitting PFC applications for projects identified as being partially funded with PFC revenues, the County will need to provide sufficient information to support its assertion that a project makes a significant contribution to one or more of the above factors. In the case of a project that would reduce congestion, the information may include a quantified measure of reduced delay per aircraft operation or reference a study that included measures of the expected congestion reduction benefits. Similarly, an assertion that a project enhances competition may be supported by information on the number of new operations that the project would provide for, the number of new entrant airlines it would accommodate, the effect on fares at the airport, and/or other measures of increased competition. In general, because "significant contribution" is a higher standard than adequate justification, more documentation is required to establish significant contribution than is typically needed for adequate justification.

The annual cost of projects identified as PFC-eligible exceeds the PFC capacity in the years in which the project costs are expected to be incurred. Thus, it is anticipated that the County may issue PFC-backed bonds to fund certain projects and that a portion of annual PFC collections will be used to pay the outstanding debt service on any PFC-backed bonds.

Master Plan projects totaling \$228.5 million are expected to be funded from PFC revenues. Of this amount, approximately \$43.4 million is anticipated to be funded on a pay-as-you-go basis and the remaining \$185.1 million is expected to be funded with bond proceeds that will subsequently be repaid with PFC revenues. **Table 1.3** presents projections of PFC revenues and PFC expenditures and reflects that ample PFC capacity exists to fund those Airport System projects identified as PFC-eligible.

Funding assumptions incorporated into the calculation of annual debt service resulting from the issuance of the bonds include the following:

- Three debt series Series 2009 is to include a portion of the projects expected to be undertaken in FY 2009 through FY 2011; Series 2015 is to include all projects expected to be undertaken in FY 2015; and Series 2017 is to include all projects expected to be undertaken in FY 2017.
- 30-year term
- No capitalized interest
- 6.5 percent interest rate
- Establishment of a Debt Service Reserve Account equivalent to the maximum annual debt service
- Level annual debt service

#### 3.2.4 Airport Funds

Under the County's existing Bond Resolution and the Airline Agreement, an Improvement and Development Fund is established that can be used for Airport System capital projects at the County's sole discretion. The Improvement and Development Fund is funded from any remaining Airport System earnings after the payment of O&M Expenses, the payment of

outstanding debt service, the funding of other reserves, and the payment of Airline Rebates. Any additional local funding, beyond what can be funded from the Improvement and Development Fund, would require the issuance of GARBs. Approximately \$18.7 million of Master Plan project costs is expected to be funded from Airport funds.

## 3.2.5 General Airport Revenue Bonds (GARBs)

The County anticipates funding the \$224 million long-term parking garage with GARB proceeds. This project is not anticipated to be necessary until FY 2023 and resulting annual debt service on the bonds is anticipated to be approximately \$20 million per year based on the following assumptions:

- 30-year term
- One year construction period and capitalized interest period
- 6.5 percent interest rate

Establishment of a Debt Service Reserve Account equivalent to the maximum annual debt service.

**Table 1.4** presents the annual estimated debt service requirements on the outstanding Airport Bonds as well as estimated debt service on projects expected to be funded with PFC-backed bonds for FY 2007 through FY 2017. As presented in Table 1.4, the annual debt service requirement is approximately \$15.2 million from FY 2007 until FY 2011 when existing annual debt service increases to \$17.3 million. In FY 2015, existing annual debt service decreases to \$6.8 million. Debt service on the County's Series 2006B Bonds was structured to increase in FY 2015 to coincide with the retirement of the outstanding Series 2001 and Series 2002 Bonds.

As described previously, estimated annual PFC-backed debt on projects included in this Master Plan is projected to total \$15.7 million in FY 2017 and ample capacity is expected to be available to fund the debt service from PFC revenues.

As described above, the parking garage is the only project included in this Master Plan that is planned to be funded with future long-term debt (\$224 million) projected to begin in FY 2023. Resulting annual debt service is conservatively projected to be \$20 million beginning in FY 2024. More detailed analysis should be performed as the project start date nears to determine if revenue bonds are the optimal funding source for this project.

| Projected Debt Service  |                               |              |              |              |              |              |              |              |              |              |              |

Prepared by: Ricondo & Associates, Inc.

Projections of future O&M Expenses are based on analysis of historical activity, the anticipated effects of inflation, planned facility improvements and expansions, and forecast activity increases. **Table 1.5** presents projected O&M Expenses for FY 2007 through FY 2017.

As shown, O&M Expenses are projected to increase from \$42.7 million in FY 2007 to \$69.6 million in FY 2017, at a compounded annual growth rate of 5.0 percent.

#### Table 1.5

| Projected O&M Expenses |              |              |              |              |              |              |              |              |              |              |              |
|------------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|

# 6.0 Airport Revenues (Nonairline and Airline)

Airport revenues are generated from nonairline sources, such as tenant leases and other miscellaneous agreements, and from airline sources in accordance with the Airline Agreements, Cargo Agreements, and the Bond Resolution. Nonairline revenues are categorized by the Direct Cost Center in which they occur.

# 6.1 Nonairline Revenues

Nonairline revenues for FY 2007 through FY 2017 are presented in **Table 1.6.** As shown, total Nonairline revenues are projected to increase from approximately \$45.6 million in FY 2007 to approximately \$63.0 million in FY 2017 at a compounded annual growth rate of 3.5 percent throughout the projection period.

#### 6.1.1 Airside

The major source of nonairline revenues in the Airside Cost Center is aviation fueling. Total Airside revenues are projected to increase from approximately \$1.3 million in FY 2007 to approximately \$2.1 million in FY 2017. This increase represents a compounded annual growth rate of 4.6 percent during this period, and is the result of forecast growth in aircraft operations and the effects of inflation during the projection period.

#### 6.1.2 Terminal

Nonairline revenues in the Terminal Cost Center primarily consist of rentals and fees from news and gift and food and beverage concessionaires, advertisers, and miscellaneous concessionaires, as well as nonairline Terminal rental revenues, airline reimbursements for tenant equipment and security charges, and federal inspection services (FIS) facility fees. These revenues are projected to increase from approximately \$7.0 million in FY 2007 to approximately \$9.5 million in FY 2017. This increase represents a compounded annual growth rate of 3.2 percent during this period, and is the result of forecast growth in numbers of enplaned passengers and the effects of inflation during the projection period.

#### 6.1.3 Ground Transportation

Revenues from the Ground Transportation Cost Center primarily consist of automobile parking revenues, taxicab and limousine parking fees, and rental car concession fees. Total Ground Transportation revenues are projected to increase from approximately \$29.4 million budgeted for FY 2007 to approximately \$40.9 million in FY 2017. This increase represents a compounded annual growth rate of 3.4 percent during this period, and is the result of forecast growth in numbers of enplaned passengers and anticipated parking rate increases as well as the effects of inflation during the projection period.

#### Table 1.6

| Projected | Nonairline | Revenues |
|-----------|------------|----------|
|-----------|------------|----------|

|                           |              |              |              |              |              | Projected    |              |              |              |              |              |
|---------------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|

| Total Nonairline Revenues | \$45,637,765 | \$46,976,362 | \$48,400,745 | \$49,919,955 | \$53,266,011 | \$54,827,577 | \$56,440,699 | \$58,087,342 | \$59,754,571 | \$61,362,966 | \$63,033,183 |

Source:Palm Beach County Department of Airports; Ricondo & Associates, Inc.Prepared by:Ricondo & Associates, Inc.

#### 6.1.4 Aviation

Revenues from the Aviation Cost Center consist primarily of facility and ground rents and flight kitchen revenues. These revenues are projected to increase from approximately \$1.7 million in FY 2007 to approximately \$2.2 million in FY 2017. This increase represents a compounded annual growth rate of 2.7 percent during this period, and reflects the expected effects of inflation during the projection period.

#### 6.1.5 Air Cargo Building

Revenues from the Air Cargo Building are projected to increase from approximately \$237,000 in FY 2007 to approximately \$318,000 in FY 2017. This increase represents a compounded annual growth rate of 3.0 percent during this period, and is the result of the expected effects of inflation during the projection period.

#### 6.1.6 Non-Aviation

Revenues from the Non-Aviation Cost Center consist of non-aviation ground and building rents. These revenues are projected to increase from approximately \$1.7 million in FY 2007 to approximately \$2.3 million in FY 2017. This increase represents a compounded annual growth rate of 3.0 percent during this period, and is the result of the expected effects of inflation during the projection period.

#### 6.1.7 Other Revenues

Revenues from the three reliever general aviation airports and investment earnings are projected to increase from approximately \$4.4 million in FY 2007 to approximately \$5.8 million in FY 2017. This increase represents a compounded annual growth rate of 3.3 percent during this period, as a result of the expected effects of inflation and increasing fund balances during the projection period.

## 6.2 Airline Revenues

The remaining revenues generated at the Airport include Terminal rentals, landing fees, and apron fees payable by the airlines. In general, the airline rate-base for the Terminal rental rate and landing fee calculations consists of the following elements:

- **O&M Expenses -** These expenses are attributed to the various rate-setting areas for the Terminal and Airside Cost Centers and the allocated portion of indirect O&M Expenses.
- O&M Reserve This requirement represents the amount necessary to fund and replenish the O&M Reserve Fund as required by the Bond Resolution, equal to one-sixth of O&M Expenses.
- **Debt Service** Debt service requirements attributable to the rate-setting areas resulting from all GARBs and subordinate indebtedness.
- **Debt Service Coverage -** The County must maintain rental rates, fees, and charges sufficient to meet the rate covenant in the Bond Resolution.

- **Debt Service Reserve Funding -** As required by the Bond Resolution, the amount, if any, required to replenish the Debt Service Reserve Account to its minimum balance.
- **Amortization** This amount represents the annual capital expenditures that were initially funded by the County and then amortized through the airline rate base over the useful life of the project.

Certain Terminal and Airside revenues offset these rate base items. As described previously, a portion of the funds remaining from the previous year (known as the Transfer) is allocated to the Signatory Airlines to partially offset their rentals, fees, and charges.

#### 6.2.1 Terminal Rentals

The Terminal rental rate calculation combines Terminal Cost Center-specific Direct and Indirect O&M Expenses and the O&M Reserve requirement; total debt service, debt service coverage, and the debt service reserve requirement; and amortization; **less:** Concourse Security Reimbursements, Air Carrier FIS facility fees, and a portion of airline catering revenues. This net requirement is divided by the sum of rentable square footage in the Terminal to determine the average Terminal rental rate per square foot. Currently, the County assigns 80 percent of the Transfer to the Terminal rental rate calculation. The Transfer reduces the average Terminal rental rate to the Signatory Airline rental rate.

**Table 1.7** presents the Terminal rental rate for FY 2007 through FY 2017. As shown, the Signatory Airline Terminal rental rate is projected to increase from \$49.17 per square foot in FY 2007 to \$56.50 per square foot in FY 2017 as a result of increasing O&M expenses partially offset by increased parking revenues and decreasing debt service that positively affect the airline Transfer included in the rate base.

#### 6.2.2 Landing Fees

The Signatory Airline landing fee calculation combines Airside Cost Center-specific Direct and Indirect O&M Expenses and the O&M Reserve requirement; total debt service, debt service coverage and the debt service reserve requirement; and amortization; **less:** non-signatory airline landing fees, Airside services revenues, aviation fueling revenues, a portion of airline catering revenues, and 10% of the Airside requirement that is recovered from Apron fees. This net requirement is divided by landed weight to determine the Signatory Airline landing fee rate. The non-signatory airlines are assessed a 25 percent surcharge on the Signatory Airline landing fee rate.

**Table 1.8** presents Signatory Airline landing fees for FY 2007 through FY 2017. As shown, the Signatory Airline landing fee rate is projected to decrease from \$0.88 per 1,000 pounds of landed weight in FY 2007 to \$0.94 per 1,000 pounds of landed weight in FY 2017 as a result of increased parking revenues and decreasing debt service that positively affect the airline Transfer included in the rate base partially offset by increasing O&M expenses.

Airline revenues are divided by the number of enplaned passengers to yield the cost per enplaned passenger for the airlines in total. The number of enplaned passengers is forecast to increase at a compounded annual growth rate of 3.0 percent from FY 2007 through FY 2017. As presented in **Table 1.9**, the airline cost per enplaned passenger is projected to decrease from \$4.93 in FY 2007 to \$4.71 in FY 2017.

# 8.0 Cash Flow

Table 1.9 also shows the funds remaining after O&M Expenses and debt service are deducted from total revenues. The funds remaining are available for the calculation of debt service coverage and to fund capital projects. This table also shows the calculation of debt service coverage.

Debt service coverage is calculated by subtracting O&M Expenses and O&M Reserve from total revenues and then dividing the result by debt service for the period. Coverage must be at least 1.25 times debt service as required by the Bond Resolution. As presented in Table 1.9, debt service coverage for the Airport is projected to be higher than the minimum 1.25 times required in every year of the projection period, indicating that the Airport System is projected to have adequate resources to meet its debt service obligations throughout the projection period.

Based on analyses of forecast activity at the Airport, in addition to projected revenues and expenses, and the Airport System Capital Improvement Plan for FY 2007 through FY 2025, it appears that the County has adequate resources and the Airport System has adequate growth capacity to meet future demand. The County has access to various sources of funding and, through a mix of FAA funding, State funding, PFC revenues, General Airport Revenue Bonds and PFC-backed bonds, and Airport funds. The capital projects recommended in the Master Plan appear to be financially feasible and the County can reasonably expect to implement these projects. The airline rates and overall airline cost per enplaned passenger remain reasonable over the shorter term planning period (through FY 2017) and projected Airport System funds appear to be adequate to effectively operate the Airport System. As required in the Bond Resolution, debt service coverage is projected to be significantly above the minimum 125 percent of debt service throughout the projection period.

The baseline financial scenario was based on eligibility of projects for various types of funding. This section evaluates a modified funding scenario based on the following assumptions:

- FAA and State Funding are capped at Historical Levels experienced by the airport system.
- PFCs are collected at a \$4.50 per enplaned passenger level.
- FAA entitlement are calculated based on the existing FAA formula incorporating the baseline forecast of enplanements and a \$4.50 PFC.
- FAA discretionary funds for FY 2008 through FY 2016 are estimated to be \$500,000 per year.
- Additional FAA discretionary funds for FY 2010 through FY 2014 are estimated to be \$100 million for the five-year period, secured with an LOI and distributed over the five-year period (\$20 million annually)
- FDOT funds are estimated to be \$2.5 million per year for PBI; and \$500,000 per year (total) for the 3 GA airports.
- FDOT (SIS) Funding is estimated to be \$10,898,000 in FY 2009.
- Timing of projects is projected to be delayed when necessary to ensure adequate funding availability.
- Hangars at reliever / general aviation airports will be funded with bond proceeds and will only be undertaken if hangar revenues are sufficient to repay annual debt service.

Based on analyses of forecast activity at the Airport, in addition to projected revenues and expenses, and the Airport System Capital Improvement Plan for FY 2007 through FY 2025 based on the above assumptions, it appears that the County has adequate financial resources and the Airport System has adequate growth capacity to meet future demand under this scenario. However, airline rates and charges would increase significantly over the baseline scenario.

**Table 1.10** presents the funding sources assumed in Scenario 1. After incorporating the funding sources and other assumptions, **Table 1.11** illustrates selected airline rates and charges, cost per enplanement, debt service coverage and ending balance in the Airport's capital account through FY 2017 that result from this scenario and compares the financial results to the baseline scenario. As presented, airline rates and charges are projected to be higher and the balance in the Airport's Improvement and Development fund is projected to be lower in Scenario 1 compared to the Baseline Scenario.

Source:Palm Beach County Department of Airports; Ricondo & Associates, Inc.Prepared by:Ricondo & Associates, Inc.

The baseline financial scenario was based on eligibility of projects for various types of funding. This section evaluates a modified funding scenario based on the following assumptions:

- FAA and State Funding are capped at Historical Levels experienced by the airport system.
- PFCs are collected at a \$6.00 per enplaned passenger level starting in FY 2009.
- FAA entitlements are calculated based on the existing FAA formula incorporating the baseline forecast of enplanements and the PFC level. When the PFC level is assumed to increase to \$6.00, entitlements will be eliminated.
- FAA discretionary funds for FY 2008 through FY 2016 are estimated to be \$500,000 per year.
- Additional FAA discretionary funds for FY 2010 through FY 2014 are estimated to be \$100 million for the five-year period, secured with an LOI and distributed over the five-year period (\$20 million annually)
- FDOT funds are estimated to be \$2.5 million per year for PBI; and \$500,000 per year (total) for the 3 GA airports.
- FDOT (SIS) Funding is estimated to be \$10,898,000 in FY 2009.
- Timing of projects is projected to be delayed when necessary to ensure adequate funding availability.
- Hangars at reliever / general aviation airports will be funded with bond proceeds and will only be undertaken if hangar revenues are sufficient to repay annual debt service.

Based on analyses of forecast activity at the Airport, in addition to projected revenues and expenses, and the Airport System Capital Improvement Plan for FY 2007 through FY 2025 based on the above assumptions, it appears that the County has adequate financial resources and the Airport System has adequate growth capacity to meet future demand under this scenario. However, airline rates and charges would increase over the baseline scenario.

**Table 1.12** presents the funding sources assumed in Scenario 2. After incorporating the funding sources and other assumptions, **Table 1.13** illustrates selected airline rates and charges, cost per enplanement, debt service coverage and ending balance in the Airport's capital account through FY 2017 that result from this scenario and compares the financial results to the baseline scenario. As presented, airline rates and charges are projected to be higher and the balance in the Airport's Improvement and Development Fund is projected to be lower in Scenario 2 compared to the Baseline Scenario. However, this scenario is projected to reflect lower rates and charges and a higher balance in the Improvement and Development Fund than Scenario 1 presented in the previous section.

|  |                            |             | Fundin        | Funding Source |               |  |

1 Airport Layout Plan

### Appendix

A FAA Airport Layout Plan Drawing Set Checklist

### 1.1 Introduction

The proposed 20-year development plan for Palm Beach County Glades (Pahokee or PHK) Airport Layout Plan (ALP) is a graphic depiction of existing and ultimate airport facilities that will be required to enable the airport to accommodate the forecast future demand. The drawing was prepared in accordance with Federal Aviation Administration (FAA) guidelines as defined in FAA Advisory Circular 150/5070-6A, *Airport Master Plans*, and Advisory Circular 150/5300-13, *Airport Design*. Furthermore, the ALP provides both airport and airfield facility data and design criteria which is required to define relationships with applicable planning and design standards. The attached drawing, entitled Airport Layout Plan, and the following paragraphs describe the major components of the future PHK development plan. Additionally, the FAA ALP Drawing Set Checklist for the Southern Region Airports Division is provided in **Appendix A**.

### 1.2 Runway System

The Palm Beach County Glades Airport runway system consists of Runway 17/35, a 4,116 foot long by 75 feet wide asphalt concrete runway. The current runway operates using declared distances because of threshold displacements on both runway ends. The Palm Beach County Department of Airports (PBC DOA) has no plans to extend this runway in the 20-year development plan future. Both runway approaches are nonprecision approaches equipped with Visual Approach Slope Indicators (VASI). The runway pavement is generally in good condition with no plans for maintenance or rehabilitation in the near future.

### 1.3 Land Acquisition

In association with runway approach protection zones, object clearing criteria, and land use compatibility issues, parcels at each end of Runway 17/35 are recommended for acquisition. Approximately 16.6 acres is recommended for acquisition in the Runway 35 RPZ, and approximately 2.9 acres is recommended for acquisition in the Runway 17 RPZ as shown on the ALP. Once these parcels are acquired, the existing structures are recommended for demolition to clear these structures from the RPZs. Aviation easements should be sought to control heights and land use within other areas of the RPZ that will not be acquired in fee simple as shown on the ALP.

### 1.4 Runway Approach Aids and Lighting

Runway 17/35 is currently and will remain a nonprecision runway in the future. The runway is equipped with medium intensity runway edge lighting. The VASI systems will be replaced in the future with Precision Approach Path Indicator (PAPI) systems.

Furthermore, Runway End Identifier Lights (REIL) are planned to be installed at both runway ends. The Runway 17/35 approaches are currently served by TVOR and DME-A equipment.

In an effort to provide enhanced facilities and aeronautical services at PHK, the Palm Beach County Department of Airports is encouraged to pursue the initiation and programming of a non-precision GPS RNAV approach, with the lowest minimums possible, to Runway 17/35 at PHK. The introduction of such an approach is aimed at providing increased training opportunities at the airport, as well as providing enhanced capability during inclement weather.<sup>1</sup>

### 1.5 Taxiway System

The parallel taxiway system consisting of Taxiway A and four connector taxiways (B, C, D, and E) serving Runway 17/35 meets FAA standards for separation between runway centerline and taxiway centerline. The taxiway pavement system is generally in good condition, with no plans for major maintenance or rehabilitation in the near future. No additional taxiway work is planned for the future. The taxiways are unlighted but are equipped with reflectors to aid pilots with taxiing operations.

### 1.6 Landside Facilities

The existing terminal building was severely damaged by hurricanes in the 2004-2005 seasons. As a result, the general aviation terminal is planned to be rebuilt to replace the existing facility within the 20 year planning period. The terminal building will be replaced with a facility of similar size and function as the previous facility. No growth in terminal facility requirements is anticipated for the 20 year planning period.

### 1.7 Aircraft Storage Facilities

In addition to the existing terminal building, an existing conventional aircraft hangar and a 10-unit t-hangar were severely damaged during the 2004-2005 hurricane seasons and are planned to be rebuilt in the 20 year planning period. A new 10-unit t-hangar west of the existing t-hangar structure is also proposed to meet forecast demand. Additional vehicle parking is also proposed adjacent to the apron to meet future parking demands.

### 1.8 Airside Development

Apron expansion is recommended for airside development at PHK to accommodate anticipated future growth of transient aircraft. Approximately 53,000 square feet of apron expansion is depicted on the ALP to provide sufficient aircraft parking space for anticipated growth in the 20 year planning period.

<sup>&</sup>lt;sup>1</sup> Recommendations of the AAAB – Addendum #1, March 10, 2008

### 1.9 Airspace

The Runway 17/35 approaches are both 20:1 nonprecision approaches and will remain as such for the forecast future.

### Airport Layout Drawing (Continued)

### Runway Data Block (Existing & Ultimate)

- % effective gradient
- % wind coverage (MPH & knots)
- Maximum elevation above MSL
- Runway length
- Runway width
- Runway surface type (turf, asphalt...)
- Runway strength (SWG, DWG...)
- Part 77 approach category (visual, NPI, PIR)
- Type instrument approach (ILS, GPS...)
- Approach slope (20:1, 34:1, 50:1)
- Runway lighting (HIRL, MIRL, LIRL)
- Runway marking (PIR, NPI, BCS)
- NAVAIDS & visual aids
- Runway safety area dimensions (standard & non-standard)

### Miscellaneous

- Airport facility/ building list (existing & future)
- Standard legend
- Location map
- Vicinity map
- Roadways, traverse ways identified
